

**SEMESTER/YEAR : III SEM/ II YEAR**  
**COURSE CODE : 25MBAS001**  
**TITLE OF THE COURSE : INTERNATIONAL SUPPLY CHAIN OPERATIONS PLANNING**  
**L: T: P: C : 3: 0: 2: 4**

## Overview

This course has been designed to give the students a holistic view of planning and operations of supply chains. It has been compiled with the users and service providers in international logistics in mind. It covers all the concepts that are important to personnel who are involved in export/import operations. All relevant issues are explained at length, this includes documentation, terms of payment, INCOTERMs, insurance & claims, risk management & currencies, and a lot more.

The concepts need to be understood and so are clearly and accurately portrayed. The vocabulary too needs to be precise. Many of the topics are technical, but need to be known by every logistics professional. Processes too need to be integrated into every business area. This course does just that.

## Course Objectives

1. Explain the principles and functions of International Supply Chain Operations Planning (ISCOP)
2. Describe various technical aspects of International Supply Chain Management
3. Develop an understanding of documentation related to international trade, transportation, insurance etc.
4. Summarize various aspects of international terminal operations like customs clearance, storage and handling
5. Practice the elements of data collection, demand and supply planning, pre-executive and executive meetings as part of S&OP process

## Course Outcomes

Upon successful completion of this course, the student will have reliably demonstrated ability to

1. Exhibit the fair understanding of concepts, theories, models and principles of International SC management and operations
2. Demonstrate the ability of applying the skill of concepts, theories, models and principles of International SC management and operations in real time problem solving
3. Demonstrate the ability of analyzing the real time problems using skill acquired by concepts, theories, models and principles of International SC management and operations

4. Exhibit the ability of designing and redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of International SC management and operations in real time problem solving course
5. Exhibit the ability of developing / redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of International SC management and operations in real time problem solving course

**SEMESTER/YEAR : III SEM / II YEAR**  
**COURSE CODE : 25MBAS002**  
**TITLE OF THE COURSE : TRANSPORTATION, INVENTORY & WAREHOUSE MANAGEMENT**  
**L: T: P: C : 3: 0: 2: 4**

## Overview

Managing inventory effectively is key to the success of a manufacturing or sales/distribution organization. The cost of holding inventory is challenging to manage if the availability of materials is ensured at all times. This course covers the commonly used methodology for optimizing inventory levels. Transportation management and planning is an important function in supply chain management in order to meet delivery commitments on time and optimize transportation costs. Complex supply chains benefit from the use of optimization software tools to achieve these objectives. The course will provide hands-on experience on these tools. The execution aspects of transportation such as freight bill, packaging and various modes of transportation will be covered in the course. Distribution systems play a critical role in maintaining inventory and meeting the requirements of the customers. There are various types of warehouses and deciding their location and size is more of a science than art.

## Course Objectives

1. Explain key terminology and concepts in inventory management and the mathematics of calculating various key parameters.
2. Use industry standard inventory control and planning tools.
3. Review the different modes of transportation, trade-offs and the resulting pricing and service implications
4. Analyze planning and management scenarios, business logics used in large scale planning of distribution and delivery
5. Identify and describe the challenges of setting up a distribution network, size and location of the warehouse and warehouse management practices

## Course Outcomes

Upon successful completion of this course, the student will be able to-

1. Exhibit the fair understanding of concepts, theories, models and principles of transportation, inventory and warehousing management.
2. Demonstrate the ability of applying the skill of concepts, theories, models and principles of transportation, inventory and warehousing management in real time problem solving
3. Demonstrate the ability of analyzing the real time problems using skill acquired by concepts, theories, models and principles of transportation, inventory and warehousing

management

4. Exhibit the ability of designing and redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of transportation, inventory and warehousing management in real-time problem-solving course
5. Exhibit the ability of developing / redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of transportation, inventory and warehousing management in real-time problem-solving course

**SEMESTER/YEAR : III SEM / II YEAR**  
**COURSE CODE : 25MBAS003**  
**TITLE OF THE COURSE : PROCUREMENT, FACTORY PLANNING & SCHEDULING**  
**L: T: P: C : 3: 0: 2: 4**

## Overview

The course is designed to provide students an understanding of Sourcing, Procuring, Manufacturing planning and execution at scale. The complexity of planning the production of a mix of products within a given time horizon with limited machines and labour resources is a daunting task. Modern software systems provide these capabilities. The course will help students appreciate these complexities, use excel based planning to gain a hands-on understanding of planning an entire factory and re-plan based on changes in requirements. Students will understand various methods of load balancing, capacity utilization and planning orders under constraints and resolving conflicting scenarios to meet delivery commitments. Procurement of material plays a great role in the efficient functioning of a supply chain for any company. There are a fair number of complexities and challenges involved in carrying out procurement in time without overshooting budgets. The course covers the procedural aspects of procurement at a tactical level as well as strategic sourcing, vendor selection included in Strategic Relationship Management. The exercises in this course and assignments will be rooted in software tools used in the industry for SRM & Procurement. Vendor performance and review are critical for a company to make/alter sourcing decisions and the course will cover this aspect as well

## Course Objectives

1. Identify the challenges in dealing with complex factory planning and scheduling scenarios; Understand factory lines, capacity and resource balancing and offloading of work orders
2. Explain the different types of manufacturing processes and their implication on planning and material movement
3. Develop an understanding of the mathematical methods and techniques used in factory planning software used in the industry today
4. Review purchase, procurement and strategic sourcing at a conceptual level; Understand the importance of inventory management including cost and service level
5. Describe the objectives of the purchase department in terms of minimizing Total Cost of Ownership, maintaining optimum inventory levels and managing vendor relations.

## Course Outcomes

Upon successful completion of this course, the student will have reliably demonstrated ability to

1. Exhibit the fair understanding of concepts, theories, models and principles of procurement, factory planning and scheduling.
2. Demonstrate the ability of applying the skill of concepts, theories, models and principles of procurement, factory planning and scheduling in real time problem solving
3. Demonstrate the ability of analyzing the real time problems using skill acquired by concepts, theories, models and principles of procurement, factory planning and scheduling
4. Exhibit the ability of designing and redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of procurement, factory planning and scheduling in real-time problem-solving course
5. Exhibit the ability of developing / redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of procurement, factory planning and scheduling in real-time problem-solving course

**SEMESTER/YEAR : III SEM / II YEAR**  
**COURSE CODE : 25MBAS004**  
**TITLE OF THE COURSE : DEMAND MANAGEMENT (DEMAND PLANNING & FORECASTING) & PROCUREMENT**  
**L: T: P: C : 3: 0: 2: 4**

## Overview

This course is intended to enable students to understand the standard industry practices used in Demand Management. The course covers another very critical aspect of demand management, i.e., demand forecasting techniques and the mathematics behind them. Traditional methods of forecasting are covered including Static, Adaptive, and Auto-Regressive Techniques, Various measures of error and how to choose the right forecasting method is also covered. Students will learn current trends in forecasting methods including the use of Artificial Intelligence techniques such as Machine Learning, and Artificial Neural Network to augment statistical methods. The course will also provide an overview of Demand planning and techniques like Linear Programming that is used for resource allocation problems

## Course Objectives

1. Learn the basics of demand management processes in large organizations
2. Understand mathematical underpinnings of forecasting
3. Understand the recent advances in forecasting
4. Learn hands on the use of demand forecasting software tools
5. Understand the Demand Planning Process

## Course Outcomes

By the conclusion of this course, the student should be able to:

1. Exhibit the fair understanding of concepts, theories, models and principles of Demand management and procurement
2. Demonstrate the ability of applying the skill of concepts, theories, models and principles of Demand management and procurement in real time problem solving
3. Demonstrate the ability of analyzing the real time problems using skill acquired by concepts, theories, models and principles of Demand Management and procurement
4. Exhibit the ability of designing and redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of Demand management and procurement in real-time problem-solving course
5. Exhibit the ability of developing / redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of Demand management and procurement in real-time problem-solving course

| Unit IV      | <b>Modern Demand Forecasting Using Machine Learning</b><br>Introduction to Machine Learning and Natural Language Processing. New methods in forecasting using Artificial Intelligence to supplement the mathematical forecast. Use of Neural Network for demand forecasting. Short term demand sensing and forecasting.                                                                                                                                                                               | 8                     |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|
| Unit V | <b>Enterprise Demand Planning</b><br>Demand management and forecasting in an enterprise. Implementing Demand Planning in an enterprise in practice. Various job functions related to demand management in a company. Annual demand planning process for the entire geography. Enterprise response to variability in demand. Understanding working with various parts of an organization in the demand planning process. Collaborating with sales, manufacturing and distribution. Manual override of the mathematical forecasts, rolling forecast revision and correction process | 8 |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|

### CO-PO Mapping

|      | PO1 | PO2 | PO3 | PO4 | PO5 |

**TITLE OF THE COURSE : SCM FOR BUSINESS IMPACT: SUPPLY CHAIN**

**METRICS, SUPPLY CHAIN ANALYTICS AND  
PERFORMANCE MANAGEMENT**

**L: T: P: C**

**: 3: 0: 2: 4**

## Overview

Efficient supply chain management can lead to impact on key business success parameters: profitability, customer satisfaction and revenue. As a result, Supply Chain Management is key not only for operational completeness but adds tangible value to any business. In order to achieve this, it is important to set appropriate KRAs and identify the right metrics, collect data and analyze the performance of the company on these parameters. This course will provide students an understanding of common metrics that are used in assessing the performance of a supply chain and tools used to analyze the data. Presentation of the right data, dashboard creation, measurement of performance and analytics at the correct level in the organization is covered in the course.

## Course Objectives

1. Recognize and understand the importance of measurement of SC parameters.
2. Use data analytics tools to gather, present and make sense of historical data of the company supply chain
3. Understand platform businesses and retailing, including customer journey mapping
4. Create reports and perform data mining to extract useful information
5. Describe the characteristics of supply chains in various types of industries including e- commerce

## Course Outcomes

Upon successful completion of this course, the student will have reliably demonstrated ability to:

1. Exhibit the fair understanding of concepts, theories, models and principles of SCM for Business Impact Course
2. Demonstrate the ability of applying the skill of concepts, theories, models and principles of SCM for Business Impact Course in real time problem solving
3. Demonstrate the ability of analyzing the real time problems using skill acquired by concepts, theories, models and principles of SCM for Business Impact course
4. Exhibit the ability of designing and redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of SCM for Business Impact in real-time problem-solving course
5. Exhibit the ability of developing / redesigning existing and new models by using the acquired skills from concepts, theories, models and principles of SCM for Business Impact in real-time problem-solving course

|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---|
| Unit I   | <b>Overview of Supply Chain Performance and its Business Impact</b><br>Basic understanding of supply chain performance parameters. Direct connection and dependency of revenue, profitability and customer satisfaction on these parameters and KRAs.                                                                                                                                                                                                                                                                               | 8 |
| Unit II  | <b>Overview of Analytics Tools</b> <ul style="list-style-type: none"> <li>● Overview of commonly used tools in Data Analytics: R, Tableau, Excel.</li> <li>● Basics of building a data warehouse, ETL and reporting.</li> <li>● Dashboard creation and insights using out-of-the-box reports.</li> <li>● Deeper insights into supply chain metrics using customized reports and dashboards.</li> <li>● Introduction to R programming and Tableau.</li> </ul>                                                                        | 8 |
| Unit III | <b>Reporting, dash boarding and data mining</b> <ul style="list-style-type: none"> <li>● Standard reports used by organizations for measurement and tracking of supply chain performance.</li> <li>● Creation of these reports using R and excel.</li> <li>● Analysis of historical data to discover trends and patterns that enable strategic decisions such as vendor selection.</li> <li>● Use of simple data mining techniques in R.</li> <li>● Strategic Challenges to retail and platform models and Future Trends</li> </ul> | 8 |
| Unit IV  | <b>Reporting, dash boarding and data mining</b> <ul style="list-style-type: none"> <li>● Standard reports used by organizations for measurement and tracking of supply chain performance.</li> <li>● Creation of these reports using R and excel.</li> <li>● Analysis of historical data to discover trends and patterns that enable strategic decisions such as vendor selection.</li> <li>● Use of simple data mining techniques in R.</li> </ul>                                                                                 | 8 |
| Unit V   | <b>Strategic Supply Chain Management</b> <ul style="list-style-type: none"> <li>● Comparison of lean and agile supply chains. Advantages and disadvantages.</li> <li>● Characteristics of supply chains in discrete, process, CPG, pharma and other industries.</li> <li>● SCM in e-Commerce: challenges, opportunities. Difference between traditional SCM and e-Commerce</li> <li>● SCM in omni-channel and retail industries</li> </ul>                                                                                          | 8 |

### CO-PO Mapping

|      | PO1 | PO2 | PO3 | PO4 | PO5 |
|------|-----|-----|-----|-----|-----|
| CO 1 | 2   | 1   | 3   | 2   | 2   |
| CO 2 | 1   | 3   | 2   | 2   | 3   |
| CO 3 | 1   | 3   | 2   | 2   | 3   |
| CO 4 | 1   | 3   | 2   | 2   | 3   |
| CO 5 | 3   | 2   | 2   | 2   | 3   |

### Action Based Component

- Mini Project on creating reports/dashboards for a dataset and obtaining insights
- Group assignment on one of the mathematical models
- Group assignment on e-commerce supply chain management
